Travel Radio Australia, and we are at the Disaster and Emergency Management Conference on the Gold Coast. I've run into some very interesting gentlemen here. We have Peter Meadowcroft from Covertex, and I have Dale Liddicoat, and he's from LEDI, yes.

First of all, Dale, you have this LEDI Nomad water filtration system, which is really great because if there's a bushfire, flood, or other sort of emergency, this can really come into play. Yeah, so the LEDI products we produce, they're called water makers, and they don't make water, but they do desalinate ocean water, river water, lake water, any sort of water source into a drinkable form, and the difference in our products to other products is that it's fully portable, it's a 12-volt system, so you can power it off your car, a battery, solar, and it will turn seawater into drinking water. That's an amazing thing, and looking at it here, it's just the size of a small suitcase, and it's a whole ecosystem in there.

Yeah, yeah, it is, and we make it here in the Gold Coast. We're an Australian veteran-owned company. We design and build all these units here locally and ship them out to marine, forward driving, and disaster relief.

When the big floods happen, especially in places like Lismore, having clean drinking water is actually number one, isn't it? Yeah, so as a veteran company, we've actually got experience in flood relief from Townsville, and the sort of inspiration that came from this was seeing pallets of bottled water being flown in and shipped out in response to a disaster, and we thought there must be a better way, like we're sending tons and tons of plastic-packaged water individually. Why don't we send one unit that can produce the same amount of water for people? You can spend money at it, and you can get a solution, but sometimes the plane doesn't turn up, and you don't have the water, and people have to go thirsty. Yeah, it's a fantastic system.

How can people find out more online about this? So we're on lediwatermaker.com or ledi.com.au. You can search either address, or you can just Google us. We've done some stuff with some social media influences lately, so we are coming up quite easily on Google. That's good, and that's L-E-D-I, Ledi.

L-E-D-I.com.au. Brilliant. Thank you very much, Dale. And over here we have Peter, Peter Meadowcroft.

And Peter, you're from Covertex, and you're involved with Ledi. Now, tell us about what you do. You have these fantastic tents here for all sorts of reasons.

Tell us a bit about that. Let's go back to what this whole conference is all about. It's emergency management, and when we have a disaster, whether it's an ocean disaster or any sort of disaster, there's two things we really need to live.

We need somewhere for shelter, and we need some water. So based on those two situations, we have the solution around that, with what we call an air shelter, which is something that can be put up by two people in 20 minutes, and from there you can start building a little community, because these tents are designed to join together as well. So you might have one for sleep, you might have one for disaster management, depending on how you want to set it up on the day.

Along with that, too, we have a water solution with the Ledi system. They do the filtration, we can store it, and then you can get it out into communities. We do them in all different sized containers, ones that can go in the back of a ute, so you can take it out to a community from that basis, and then store it in the community base where you are.

Yes, because when people lose their homes, they've just got nowhere to stay, and often they're put into community centres and halls and things, but that's not really a long-term solution, is it? No, it's not a long-term solution, and also sometimes those aren't available at that solution as well. So this is a solution you could throw in the back of our air shelters, you could put it in the back of a ute or helicopter in, and you'll have a housing situation that you could have up in 20 minutes, and they're designed to be in water. Now, an example is down on the west coast of New Zealand, where we actually do make these in New Zealand, but the west coast of New Zealand has got the highest rainfall in the world.

We still have these totally—they were designed for that area, so there's no way there's water going to go into them. If it's a flood situation as well, they're a totally sealed unit, so the water is just not going to get in there. You can rely on it being a dry shelter.

Now, I'm looking at these, they sort of go in—as you say, they go in modules, and you can join them together to make a little, small little town, really, can't you? We have actually done that on a number of occasions. We've had Defence work with Health, with Civil Defence, and they're all working together, and they can all tie their shelters together as well to make a community. Yes, it's very good.

How can people find out more about this online? Come online. We have a couple of websites. We can go to covertex.co.nz, or we can go to structureflex.co.nz as well.

We're a New Zealand-based company, but we do a lot of work in Australia as well. Thanks so much for being part of the program. Before we go, what's your impressions of the conference? It's one situation where we're all getting together as a sector around emergency management, so it's brilliant to be able to work and see and talk to different people about different solutions and work all together as well.

Thanks so much for being part of the program. Thank you very much. And thank you very much.

Thanks.
